

ORALPROX®

The pocket-size interdental brush

Where the brush
won't reach...

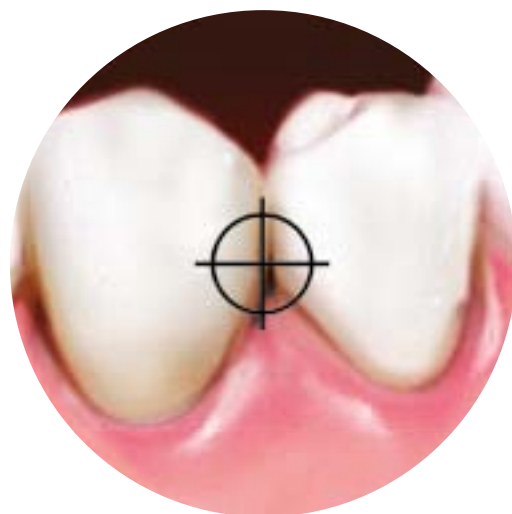

INTERNATIONAL DENTAL SUPPLY

More than 80% of all teeth and gum disease occurs in interdental spaces.

Particles of food and bacterial plaque deposit in areas that are hard to reach with a normal toothbrush.

This bacterial plaque not only causes caries, but also swollen, red and bloody gums. If neglected, gingivitis develops real periodontal disease that, often without symptoms, erodes the bone tissue under the gums, leading to loss of teeth.
